AEROCLO

Data description

Abstract

Three-dimensional air mass back-trajectories calculated using the NOAA HYbrid Single-Particle Lagrangian Integrated Trajectory Model (HYSPLIT; Draxler and Rolph, 2015). The model uses the Weather and Research Forecasting (WRF 3.7, Skamarock et al., 2008) simulations at 50, 9 and a nested simulation at 3 km of horizontal resolution. The global meteorological analyses from the National Centers for Environmental Prediction (NCEP) with the GlobalForecast System (GFS) products are used to nudge WRF hourly with pressure, temperature, humidity and wind. To preserve large scale circulations and small scale variability, the 'spectral nudging' technique was applied (Von Storch et al., 2000).

Data are provided as daily ascii files and images in png format

Observing strategy

Simulations for Henties Bay at 50 and 9 km and a nested simulation at 3 km of horizontal resolution.

Data use information

Use constraints:	<p>The Principal Investigator(s) of the AEROCLO-sA campaign is Paola Formenti. If you intend to use the following data please contact her by e-mail: paola.formenti@lisa.ipsl.fr. The back-trajectories were calculated by Guillaume Siour (LISA, guillaume.siour@lisa.ipsl.fr). Please consider authorship for both whenever using the data.</p> <p>The LISA (www.lisa.u-pec.fr) is a joint research unit of the CNRS, University Paris-Est Créteil and University of Paris).</p>
Data policy:	AEROCLO data policy
